Name: _____

Major: _____

Quiz #1
EGRE246
ABET Assessment

Answer all questions in the space provided. You do not need to write complete programs; however, be sure to define any extra variables should you need them to answer the question correctly. **Do not write on the back of the quiz!**

1. Write the code to swap (exchange) the values stored in integer variables `x` and `y` .

2. Declare the integer array variable `intList` with SIZE number of cells in such a way that all of its elements are initialized to zero (0). (In other words you cannot use a loop and assignment to set the values to zero.)

3. Given integer array `list` of size `n`, write the code to determine and then print out the number of items in `list` that are greater than zero (0).

4. Write the C function `isEven` that is passed a single integer and returns true of the integer is even (i.e. evenly divisible by 2), false otherwise.

5. Given the pointer variable `ptr` that points to the beginning of an float array of size `n`, print out the 3rd item (i.e. the 3rd item as one would count by hand) in the array. You may assume the array has at least three items.
