Quiz #3

EGRE246

Name: _____

1. Write a C function to reverse an array using pointers. You need to physically reverse the array and cannot just display as a reverse order (5 points).

Example:
Input array elements: 10 20 30 40 50 60 70 80 90 100
Output
Reversed array: 100 90 80 70 60 50 40 30 20 10

```
void ReverseArray(int *parray, int size) {
    int *start, *end;  int temp;
    start = parray;
    end = parray + size-1;
    while (start < end ) {
        temp= *start;
        *start = *end;
        *end = temp;
        start++;
        end--;
    }
}
```

2. How do you ensure data integrity of encapsulated data when writing a module in C? Explain your answer for full credit (3 points).

static variables to ensure data integrity. Those static variables can not be accessed outside of a module.
